

NB07-1208

Add a definition for Thermal Fluid Heater to the Glossary of all three parts.

This action item is an attempt to expand the glossary of the NBIC.

Thermal Fluid Heater- A thermal fluid heater is a closed vessel in which a fluid other than water is heated by the direct application of heat from a thermal energy source. Depending on the process heating requirements, the fluid may be vaporized with normal circulation but, more often, the fluid is heated and circulated by a pump.
